KEEP CALM AND BUILD ORGANISATIONAL RESILIENCE

More than 3000 construction firms in the UK consistently fall into insolvency every year. Brought into public spotlight following the high-profile collapse of Carillion in 2018, this number is far greater than any other sector, and costs society several hundreds of millions of pounds and environmental harm in its wake. Using a Design Science Research approach, Tim Whitehill (DBA Candidate), is conducting a pragmatic investigation of this problem, to design an artefact that operationalises organisational resilience in construction sector firms... thereby building a better chance for their long-term survival and prosperity.
